# Data Appendix for "Durability of Output and Expected Stock Returns"

João F. Gomes, Leonid Kogan, and Motohiro Yogo<sup>‡</sup>

December 10, 2006

## 1 Introduction

We construct a new industry classification based on NIPA's Benchmark Input-Output Accounts. We classify each SIC industry according to its contribution to final demand, with a detailed breakdown for personal consumption expenditures (PCE). We use the industry classification to construct industry portfolios in "Durability of Output and Expected Stock Returns."

# 2 Classifying SIC Industries by Final Demand

At the end of this document is a table that assigns each SIC industry to a category of final demand. The table consists of four columns. The first column indicates the category of final demand abbreviated as follows.

• d.: PCE on durable goods.

<sup>\*</sup>The Wharton School, University of Pennsylvania and CEPR (e-mail: gomesj@wharton.upenn.edu). †Sloan School of Management, MIT and NBER (e-mail: lkogan@mit.edu).

<sup>&</sup>lt;sup>‡</sup>The Wharton School, University of Pennsylvania and NBER (e-mail: yogo@wharton.upenn.edu).

- n.d.: PCE on nondurable goods.
- s.: PCE on services.
- I: Gross private domestic investment.
- G: Government consumption expenditures and gross investment.
- NX: Net exports of goods and services.

For goods that are part of PCE, the second column indicates the detailed category of PCE. The third and fourth columns indicate the SIC industry and its description, respectively.

To construct the table, we start with the 1987 Benchmark Input-Output Accounts (Bureau of Economic Analysis 1994). It is available in electronic format through the webpage

#### http://www.bea.gov/bea/dn2/i-o\_benchmark\_1987.htm

The following tables are relevant for our construction.

- SIC-IO Table: Industry Classification of the 1987 Benchmark Input-Output Accounts.
- IO Table 2: The Use of Commodities by Industries.
- IO Table D: Input-Output Commodity Composition of Personal Consumption Expenditures in Producers' and Purchasers' Prices.

We use the 1987 input-output accounts because the industry classifications in the CRSP database are based on the 1987 SIC codes. However, we have examined the input-output accounts from other available years (1958, 1963, 1967, 1977, 1992, and 1997) to verify that the industry definitions are stable over time. The construction of the table proceeds through the following steps.

#### 2.1 Link from SIC Code to I-O Code

SIC-IO Table is the key table that links each I-O code to related, and potentially multiple, 1987 SIC codes. The link occurs at various levels of detail from two- to four-digit SIC. We exclude wholesale and retail (SIC 5000–5999) and financial (SIC 6000–6999) industries. For wholesale and retail, a detailed breakdown of value added by PCE category is not available in the public data. Similarly, the input-output accounts are not designed to give a precise breakdown of valued added for the financial sector.

## 2.2 Link from I-O Commodity to Final Demand

IO Table 2 identifies the I-O commodity composition of each final good measured at producers' prices. The categories of final demand are consumption (I-O code 910000), investment (I-O code 920000–930000), government expenditures (I-O code 960000–993009), and net exports (I-O code 940000–950000). Each I-O commodity potentially contributes to multiple categories of final demand. However, we create a unique link by assigning each I-O commodity to the category of final demand to which it has the highest value added.

We merge the link from SIC code to I-O code with this link from I-O commodity (each identified by an I-O code) to final demand. The merge produces a multiple-to-multiple link between SIC code and final demand. We then aggregate value added over all pairs of SIC and final demand at the two-, three-, and four-digit SIC code. The aggregation produces a one-to-one link between SIC code and final demand.

#### 2.3 Link from I-O Commodity to PCE

IO Table D identifies the I-O commodity composition of each PCE good measured at producers' prices. The BEA defines PCE through the following categories of durability.

• Durable goods: Furniture and household equipment, motor vehicles and parts, and other durable goods.

- Nondurable goods: Clothing and shoes, food, fuel oil and coal, gasoline and oil, and other nondurable goods.
- Services: Household operation, housing, medical care, net foreign travel, personal business, personal care, private education and research, recreation, religious and welfare activities, and transportation.

Each I-O commodity potentially contributes to multiple categories of PCE. However, we create a unique link by assigning each I-O commodity to the category of PCE to which it has the highest value added.

We merge the link from SIC code to I-O code with this link from I-O commodity to PCE. The merge produces a multiple-to-multiple link between SIC code and PCE. We then aggregate value added over all pairs of SIC and PCE at the two-, three-, and four-digit SIC code. The aggregation produces a one-to-one link between SIC code and PCE.

### 2.4 Classifying Industries

We first use the link between SIC and final demand to classify each SIC industry into mutually exclusive categories: consumption, investment, government expenditures, and net exports. Within the set of industries that are classified as consumption, we then use the link between SIC and PCE to classify each industry into mutually exclusive categories: durable goods, nondurable goods, and services.
