

Online Appendix for “Foreign STEM Workers and Native Wages in U.S. Cities”

Giovanni Peri (UC Davis) Kevin Shih (UC Davis)
Chad Sparber (Colgate University)

April 2014

This appendix provides supplemental clarification about the data and variables that we analyze in “STEM Workers, H-1B Visas, and Productivity in U.S. Cities.” In Section 1 we describe the sample criteria used to construct the dataset and our dependent variables in particular. Section 2 outlines how we define demographic groups, industries, occupations, and STEM workers. Such definitions aid in understanding the variables used in the empirical analysis. Section 3 then describes how we construct the H-1B instrument, control variables, and data used in the paper’s falsification and robustness checks.

1 Data Selection

All data on wages, employment, rent, occupation, industry, nativity, and education come from IPUMS.¹ Specifically, we extract samples of workers from the 1970, 1980, 1990, and 2000 Census, the 2005 American Community Survey (ACS), and the 2008-2010 3-Year ACS (which we refer to as 2010). The IPUMS Censuses are 5% random samples of the U.S. population, with the exception of 1970 when we use the Form 1 Metro 1% sample. The 2005 ACS is a 1% sample, and the 3-Year 2008-2010 ACS is a 3% sample. We focus our analysis on 219 Metropolitan Statistical Areas (MSAs) that are consistently identified from 1980-2010, excluding individuals who do not live in identified MSAs. Our dependent variables of interest include employment, wage, and rent outcomes.

Our “employment sample” calculates various employment variables by counting the number of workers for different demographic groups. This sample is restricted to non-institutionalized individuals between ages 18 and 65 (inclusive) who report positive weeks worked over the previous year. We exclude individuals in military occupations, unidentified occupations, and occupations that cannot be consistently identified over time.²

Our “wage sample” provides wage variables that measure average weekly wages in MSAs for various demographic groups. This sample further refines the employment selection criteria to only include individuals who report positive wage and salary income over the previous year.

¹See Ruggles et. al (2010).

²Section 2.2 describes our efforts to create a time-consistent occupation classification scheme. Only four occupations cannot be subsumed into other larger occupational groupings so as to be identified consistently across our sample time frame.

Annual wage and salary incomes are converted to constant 2010 dollars using the BLS Inflation Calculator (http://www.bls.gov/data/inflation_calculator.htm). Weekly wages are then calculated by dividing each individual’s annual wage and salary income by their annual weeks worked. Weighted averages for the appropriate demographic group are taken within each MSA using sample person weights.

Similarly, our “rent sample” further restricts the employment sample to renters who report positive monthly housing rent. Our rent variables then measure the average and median monthly household rent per room of native-born Americans in MSAs. Values are converted into constant 2010 dollars using the BLS Inflation Calculator. Averages and medians are calculated for the appropriate demographic groups in each MSA using person weights.

2 Defining Groups, Industries, and Occupations

2.1 Demographic Groups

Demographic groups are defined by nativity and educational attainment. We classify workers as native or foreign according to their country of birth and whether they were born abroad to U.S. citizens. Natives are those born in the United States or born abroad to U.S. citizens. Persons born outside the U.S. to non-U.S. citizens are classified as foreign. Individuals without an identified place of birth are removed from the analysis. Foreign workers are further classified into one of 14 aggregated foreign nationality groups based upon their country of birth. Those regions are Canada, Mexico, Rest of Americas (excluding the USA), Western Europe, Eastern Europe, China, Japan, Korea, Philippines, India, Rest of Asia, Africa, Oceania, and Other.

The analysis often groups workers by education level, which we measure according to the highest degree a person has attained. College-educated workers are those with a bachelors degree or higher, and non-college workers are those without a bachelors degree. In part of our analysis, we also divide non-college workers into those with less than a high school degree and those with at least a high school degree.

2.2 Time-Consistent Industries and Occupations

IPUMS modifies occupation and industry codes to provide time consistent classification schemes based upon the Census Bureau’s 1990 occupation and industry categories. These harmonized codes facilitate data analysis over time. Our analysis requires a few additional adjustments to these codes.

First, we use our employment sample and refine the IPUMS 1990 occupational classification by examining the complete list of occupations available in each year of our analysis. Those occupations appearing in each year are called “time-consistent.” Those not identified in all years are “time-inconsistent” and are then recoded to match their most similar time-consistent occupations. The refinement narrows the IPUMS 1990 occupational classification from 389 occupations to 331 time-consistent ones.

Occupations that are recoded as time-consistent are shown in Table A1. For example,

“Mechanical engineering technicians” are only identified prior to 2000, whereas “Engineering technicians, n.e.c.” are identified in all years. Thus, we recode “Mechanical engineering technicians” in the 1970, 1980, and 1990 Censuses as “Engineering technicians, n.e.c.” There are only four occupations³ in which no logical time-consistent matches were available, and thus we drop individuals with these occupations from the analysis.

We follow the same procedure for the IPUMS 1990 Industrial Classification. We replace industries that do not appear in all years of the sample with the most similar time-consistent industry code. All time-inconsistent industries are matched with the most similar time-consistent industry. This refinement narrows the number of industries from 243 to 212.

2.3 Defining STEM Occupations

Our key explanatory variable measures foreign STEM worker growth over periods, standardized by initial city employment. We use the employment sample and person weights to calculate the number of foreign-born workers in STEM occupations and total city employment (native & foreign) in each of the 219 MSAs. Unfortunately, there is no single definition of STEM occupations. We therefore create four distinct STEM classification schemes – using the employment sample detailed in Section 1 – that attempt to identify occupations that require workers to possess high STEM knowledge or skills. To do this we create two different measures of an occupation’s STEM intensity. For each of the two STEM measures, we then choose two different cutoff values at which to separate STEM and non-STEM occupations.

The first measure of the STEM intensity of occupations is derived from the O*NET database, provided by the U.S. Department of Labor. O*NET provides a score measuring the importance of several dozen skills and abilities used in performing the job for each Standard Occupational Classification (SOC) occupation. We select four O*NET skills that involve the use of Science, Technology, Engineering, and Math – “Mathematics in Problem Solving,” “Science in Problem Solving,” “Use of Technology Design,” and “Programming.”

We crosswalk the STEM skill scores from each SOC code to the more aggregated Census 2010 occupation code. Census occupation O*NET skill values initially represent the unweighted average of each SOC occupation’s values within them, but are then rescaled so that values equal percentiles measuring the share of the labor force using less of the particular skill in 2010. We then take the weighted average of these percentiles within our refined time-consistent IPUMS 1990 occupational classification codes. Our ultimate STEM skill score simply equals the average of the four O*NET skill percentile variables discussed above. Finally, we rank occupations according to this STEM skill score and define the occupations comprising the top 4% (strict) or 8% (broad) of employment as STEM. We call these the O*NET 4% and O*NET 8% STEM occupation definitions.

The second measure of STEM occupational intensity is derived from information on college majors in the 2010 American Community Survey. For each occupation we calculate the share of all workers with bachelor degrees in STEM fields. We then rank occupations according to their share of workers with STEM college majors and choose those comprising 4% (strict) and 8% (broad) of employment in 2010 as STEM occupations. We call these the

³Those occupations are Adjusters and calibrators; Other precision and craft workers; Other telecom operators; and Supervisors of guards.

Major-Based 4% and Major-Based 8% STEM occupation definitions.

As there is no single definition of STEM occupations, there is also no single definition of STEM majors. We select a group of majors that are consistent with a list of designated STEM degree programs used by U.S. Immigration and Customs Enforcement (ICE). There is no available crosswalk between ICE classified majors and the majors classified under the 2010 ACS. The list of STEM majors selected from the ACS is shown in Table A3.

3 Constructing the Instrument, Control Variables, and Data for Falsification Tests

3.1 H-1B Instrument

The H-1B driven instrument relies upon non-immigrant visa issuance data by nationality from 1997-2010 and total non-immigrant visa issuance data from 1990-2010. Though we refer to our instrument as an “H-1B-driven” variable, it also accounts for TN visa issuances. Like the H-1B, the TN (or NAFTA treaty) visa is awarded to workers in specialty occupations. However, the TN visa has no cap, is reserved for Canadian and Mexican workers, and has grown in popularity among citizens from those countries since 2004 when the H-1B cap reverted to 65,000 per year.

We use the employment sample to calculate the number of foreign workers in STEM occupations, by nationality, for each city, in 1980. We place individuals into the 14 aforementioned foreign nationality groups (n), each of which represents a source region accounting for a large share of H-1B visa issuances. As detailed in Section 3.2 of the main paper, we calculate the aggregate growth in foreign STEM workers from 1980 to each year in our sample ($t = 1990, 2000, 2005, 2010$) for each nationality. We first add the census inflows of foreign STEM workers of nationality n from 1980-1990 to the total number of H-1B visas issued to those nationalities from 1990 – t . We then divide this number by the total U.S. stock of STEM workers from nationality n in 1980 to get the growth factor. Data on H-1B and TN visas issued by nationality are available each year beginning in 1997. Since we require total inflows from 1990, we have to impute the total number of visas issued from 1990 – t , as detailed in the footnotes in Section 3.2 of the main paper.

Our instrument is formed by taking changes in these predicted values over our periods and standardizing by imputed initial city employment. This imputation avoids endogenous changes in total employment at the city level from affecting our instrument. To impute city employment we predict employment in cities for each of four separate demographic groups X (native college, native non-college, foreign college, and foreign non-college workers) using their initial city stocks in 1980 and interacting it with their national growth since 1980. We predict each city’s number of workers ($\widehat{E}_{c,t}^X$) of each demographic group X in years 1990, 2000, 2005, and 2010 as $\widehat{E}_{c,t}^X = E_{c,1980}^X \left(\frac{E_t^X}{E_{1980}^X} \right)$, where $E_{c,1980}^X$ is city c ’s 1980 stock of group X workers, E_t^X is the national total number of workers of group X in year t , and E_{1980}^X is the national total number of group X workers in 1980. Next, we sum the four groups to obtain our imputed city employment ($\widehat{E}_{c,t}$) which we then use to standardize changes in

our instrument’s city-level H-1B-driven predicted foreign STEM.

3.2 Controls and Data Used in Falsification Tests

Foreign Non-College Imputed Growth and Bartik Control Variables

Section 4.2 of the main paper describes the construction of our foreign non-college imputed growth and Bartik control variables. Here, we provide a few added details. For the imputed growth in foreign non-college educated workers, the variable is formed by taking changes (over the defined time-periods) in the predictions of non-college workers in cities, standardized by imputed city employment, $\widehat{E}_{c,t}$. For the Bartiks, note that they rely on variation in a city’s workforce by industry. Bartik employment variables are constructed using the employment sample, and the Bartik wage variables are constructed using the wage sample. Section 2.2 provided further details about how we refined the industrial classification for time-consistency across all years of our sample. We further change the sample by removing individuals in military and unidentified industries in the construction of our Bartik variables.⁴

Aggregate H-1B Instrument: Kerr & Lincoln (2010)

One of the falsification tests we use to check the validity of our identification strategy is to construct the instrument without relying on variation across nationalities. This is similar to the method used in Kerr and Lincoln (2010). It addresses the concern that individual nationality groups may have specific location preferences that are affected by particular industries. That is, the presence of specific nationality groups and their subsequent growth may simply proxy for the success of particular industries. To avoid this issue, we construct an aggregate instrument by first interacting total foreign STEM in 1980 with H-1B-driven U.S. growth rates as follows,

$$\widehat{STEM}_{c,t}^{FOR,agg} = STEM_{c,1980}^{FOR} \left(\frac{STEM_t^{FOR}}{STEM_{1980}^{FOR}} \right)$$

In the above equation, $STEM_{c,1980}^{FOR}$ is the total number of foreign STEM workers in city c in 1980. This is multiplied by the national growth factor of foreign STEM since 1980, calculated as the ratio of the national total foreign STEM workforce in year t ($STEM_t^{FOR}$) over the total foreign STEM workforce in 1980 ($STEM_{1980}^{FOR}$).

Instrument Falsification: Non-College Immigrant Flows

To check that it is truly fluctuations in H-1B visa policy that drive our instrument and not simply overall growth in labor demand (that itself is possibly driven by particular cities), we construct an instrument that uses aggregate non-college immigrant inflows instead of H-1B flows. We do this by interacting the city distribution of foreign STEM workers by nationality in 1980 with a growth factor that is calculated by adding the census inflow of foreign STEM workers of nationality n from 1980-1990 with the census inflow of non-college immigrants of nationality n from 1990 – t . Specifically,

⁴Those in military and unidentified occupations are omitted from the analysis entirely.

$$\frac{\widetilde{STEM}_t^{FORn,noncoll}}{STEM_{1980}^{FORn}} = \frac{STEM_{1980}^{FORn} + \Delta STEM_{1980-1990}^{FORn} + \Delta Noncoll_{1990-t}^{FORn}}{STEM_{1980}^{FORn}}$$

Notice that the above equation is quite similar to the construction of the main H-1B-driven instrument in Equation (3) of the main paper, but it replaces H-1B visas issued to nationality group n ($\#of H1B_{1990-t}^{FORn}$) with $\Delta Noncoll_{1990-t}^{FORn}$, the Census-measured inflow of non-college immigrants of nationality n .

To construct our falsification instrument we then multiply this growth factor by the 1980 distribution of foreign STEM, and sum across nationalities to obtain

$$\widetilde{STEM}_{c,t}^{FOR,nocoll} = \sum_{n=1,14} STEM_{c,1980}^{FORn} \left(\frac{\widetilde{STEM}_t^{FORn,noncoll}}{STEM_{1980}^{FORn}} \right)$$

Our falsification instrument is formed by taking changes of $\widetilde{STEM}_{c,t}^{FOR,nocoll}$ over periods and standardizing by the imputed initial city employment, $\widehat{E}_{c,t}$.

Instrument Falsification: Total Immigrant Flows

To further ensure our instrument is driven by H-1B policy fluctuations and not by overall labor demand growth, we construct another falsification variable that uses total immigrant inflows, net of H-1B inflows, rather than only non-college immigrant inflows. This is done by first calculating total immigrant inflows and netting out the number of H-1B visas issued,

$$\Delta Total_{1990-t}^{FORn,netH-1B} = \Delta Total_{1990-t}^{FORn} - \#of H1B_{1990-t}^{FORn}$$

We then calculate growth factors as before,

$$\frac{\widetilde{STEM}_t^{FORn,tot}}{STEM_{1980}^{FORn}} = \frac{STEM_{1980}^{FORn} + \Delta STEM_{1980-1990}^{FORn} + \Delta Total_{1990-t}^{FORn,netH-1B}}{STEM_{1980}^{FORn}}$$

Here we replace $\#of H1B_{1990-t}^{FORn}$ in Equation (3) of the paper with $\Delta Total_{1990-t}^{FORn,netH-1B}$, the Census-measured inflow of total immigrants of nationality n net of H-1B flows. To construct our falsification instrument we multiply this growth factor by the 1980 foreign STEM distribution across cities and sum over nationalities,

$$\widetilde{STEM}_{c,t}^{FOR,tot} = \sum_{n=1,14} STEM_{c,1980}^{FORn} \left(\frac{\widetilde{STEM}_t^{FORn,tot}}{STEM_{1980}^{FORn}} \right)$$

Our falsification instrument is formed by taking changes of $\widetilde{STEM}_{c,t}^{FOR,tot}$ over periods and standardizing by imputed initial city employment, $\widehat{E}_{c,t}$.

Instrument Falsification: 1980 Distribution of Immigrants in Manual Occupations

A third falsification test involves replacing the base year distribution of foreign STEM workers in the instrument with the distribution of foreign workers in manual occupations. We define manual occupations based on a measure of the manual-intensity of occupations used in Peri and Sparber (2009). In particular, Appendix Table A1 of Peri and Sparber (2009) lists 19 O*NET variables used to construct a “Basic Definition” of manual skills. We combine those O*NET variables into a single index of an occupation’s manual skill intensity. We then define manual occupations as those among the top 8% manual-intensive occupations.⁵

To construct the instrument, we interact the 1980 city distribution of foreign manual occupation workers, by nationality, with the same national H-1B driven growth factors used to construct the main instrument.

$$\widetilde{STEM}_{c,t}^{FOR,manual} = \sum_{n=1,14} Manual_{c,1980}^{FORn} \left(\frac{\widehat{STEM}_t^{FORn}}{\widehat{STEM}_{1980}^{FORn}} \right)$$

In the above equation, $\left(\frac{\widehat{STEM}_t^{FORn}}{\widehat{STEM}_{1980}^{FORn}} \right)$ is the same as detailed in Equation (3) of the paper, while $Manual_{c,1980}^{FORn}$ is city c ’s total number of foreign workers of nationality n in a manual occupation in 1980. The instrument is then formed by taking changes of $\widetilde{STEM}_{c,t}^{FOR,manual}$ over periods and standardizing by initial imputed city employment, $\widehat{E}_{c,t}$.

⁵The procedure for defining the dichotomous manual occupation classification is analogous to the STEM occupation classification scheme outlined in Section 2.3.

Online Appendix Tables

Table A1: Time-Consistent Occupations

Original (Time-Inconsistent) Occupation	Replacement (Time-Consistent) Occupation
Fabricating machine operators, n.e.c.	Assemblers of electrical equipment
Cost and rate clerks (financial records processing)	Billing clerks and related financial records processing
Legislators	Chief executives and public administrators
Tailors	Dressmakers and seamstresses
Electrical and electronic (engineering) technicians	Engineering technicians, n.e.c.
Mechanical engineering technicians	Engineering technicians, n.e.c.
Technicians, n.e.c.	Engineering technicians, n.e.c.
Marine life cultivation workers	Farm workers
Farm managers, except for horticultural farms	Farmers (owners and tenants)
Horticultural specialty farmers	Farmers (owners and tenants)
Managers of horticultural specialty farms	Farmers (owners and tenants)
Water transport infrastructure tenders and crossing guards	Freight, stock, and materials handlers
Stenographers	General office clerks
Production checkers and inspectors	Graders and sorters in manufacturing
Nursery farming workers	Graders and sorters of agricultural products
Private household cleaners and servants	Housekeepers, maids, butlers, stewards, and lodging quarters cleaners
Materials movers: stevedores and longshore workers	Laborers outside construction
Stock handlers	Laborers outside construction
Judges	Lawyers
Postmasters and mail superintendents	Managers and administrators, n.e.c.
Statisticians	Mathematicians and mathematical scientists
Crushing and grinding machine operators	Mixing and blending machine operatives
Shaping and joining machine operator (woodworking)	Nail and tacking machine operators (woodworking)

Duplication machine operators / office machine operators	Office machine operators, n.e.c.
Other precision woodworkers	Other woodworking machine operators
Hand painting, coating, and decorating occupations	Painting machine operators
Information clerks, nec	Receptionists
Office machine repairers and mechanics	Repairers of data processing equipment
Tinsmiths, coppersmiths, and sheet metal workers	Sheet metal duct installers
Sociologists	Social scientists, n.e.c.
Biological science instructors	Subject instructors (HS/college)
Chemistry instructors	Subject instructors (HS/college)
Earth, environmental, and marine science instructors	Subject instructors (HS/college)
Economics instructors	Subject instructors (HS/college)
Education instructors	Subject instructors (HS/college)
Engineering instructors	Subject instructors (HS/college)
History instructors	Subject instructors (HS/college)
Home economics instructors	Subject instructors (HS/college)
Law instructors	Subject instructors (HS/college)
Math instructors	Subject instructors (HS/college)
Physics instructors	Subject instructors (HS/college)
Psychology instructors	Subject instructors (HS/college)
Sociology instructors	Subject instructors (HS/college)
Theology instructors	Subject instructors (HS/college)
Teacher's aides	Teachers , n.e.c.
Photoengravers and lithographers	Typesetters and compositors
Printing machine operators, n.e.c.	Typesetters and compositors
Other precision apparel and fabric workers	Upholsterers
Food counter and fountain workers	Waiter's assistant
Solderers	Welders and metal cutters
Lay-out workers	Wood lathe, routing, and planing machine operators
Adjusters and calibrators	<i>No clear match</i>
Other precision and craft workers	<i>No clear match</i>
Other telecom operators	<i>No clear match</i>
Supervisors of guards	<i>No clear match</i>
